How to update your home network Router

Routers need updates from your internet service provider, you should reboot your home routers at least once a week. Home routers also tend to slow down over time especially under heavy use. By rebooting your home router, you help to clear out anything that may be stuck in the router’s memory (just like rebooting your computer). The best way to do this is to unplug the power cord from your router, count to 30, and plug it back in.
